

Make use of “Cloning” for a dynamic music video or scene

One of my favorite music videos, directed by Michel Gondry, Kylie Minogue's [“Come Into My World.”](#)

A relatively simple conceit masks a mountain of cuts and technical complexity, but I think it's worthy inspiration for a VR music video. As we know, VR's FOV is often quite wide; talent is often swimming in the frame and gets lost in it if they move too far from the camera. Doing the classic and simple cloning-by-matteing in a VR frame could afford us far more subjects on screen that could interact in coordinated ways. Some motion-controlled movement may even be able to afford more complex effects.

Orphan Black, a show known for frequent use of camera tricks to use the same actor for multiple roles.

The Interrogation

When ideating interesting fixed perspectives, a classic trope is someone tied to a chair or cuffed to a table while their captors attempt to cajole them and break their will, or worse.

After the bag is removed from their view, the scene has the potential for intimate scene work as well as intense interactions. Why are they there? Do they know something? Victim of circumstance? And how will they make their escape?

Set design can also be gritty, urban, with the claustrophobic potential of VR.

The Car Ride

Another scenario with relatively fixed vantage points is as a passenger within a car. While presenting a host of technical issues (control/lighting of anything outside the car, audio, safety), it also offers much more dynamic visuals than the average VR production that relies on a static position.

Plots could be scaled to be more manageable; following a delivery driver through a suburban neighborhood that may be delivering more than they expect, a passenger on a tense roadtrip

The Estate

With regards to the suggestion of iconic Victorian mansions as locations, these settings evoke Downton Abbey, Bridgerton, and other period pieces centered around household politics and gossip.

With an emphasis on different settings within the home, allowing production designers to take advantage of interesting architecture and lighting, we could stage a variety of monologues in close-up where the members of the household describe their perspective on the latest scandalizing events of the household.

By using closeups you can take provide an intimate private conversation experience while also being able to take in majestic interiors while experiencing a farcical plot.

Who am I?

I'm a Brooklyn based filmmaker with over a decade of experience writing, directing, producing, and editing for myself as well as in-house at Comedy Central. I have an interest in the cutting edge and immersive and virtual production. With some background in Mathematics and Computer Science as well as passing experience with Unreal Engine, I'd be interested in collaborating or co-producing on future VR projects.
